WORLD COCOA DEVELOPMENTS

AND OUTLOOK

JUN 1 3 1958

#### Production

World cocoa production during the 1957-58 (October-September) year probably will not exceed 1,725,000,000 pounds. This would be 310,000,000 pounds or 15 percent below 1956-57. With such a relatively low production, world stocks probably will decrease somewhat, even though prospects indicate lower consumption in 1958 than in 1957.

#### Africa

The 1957-58 cocoa output is smaller than expected primarily because of heavy rains which continued well into the harvesting season in the major producing countries of Ghana, Nigeria and French West Africa. These rains interfered with harvesting, increased black pod damage, and hampered fermentation and marketing. The Cameroun, however, did not have bad weather, and the 1957-58 crop there probably will be larger than in 1956-57.

Weather conditions in Ghana, the world's largest producer, during the first several months of 1958 has been reported as very favorable, and the trees are said to be in good condition. Therefore, there are strong hopes for a good 1958-59 main crop. During 1957 a total of 5,456,848 Amazon seedlings and 1,205,000 Amazon pods were distributed to the farmers. Weather has been favorable for replanting and for new plantings, and the survival of seedlings have been excellent. Swollen-shoot is reportedly being kept in check. A total of 67,204,670 cacao trees have been cut out since the beginning of the control work in 1945. Field trials, using ant control

to reduce the vector population, have not greatly reduced mealy bugs. Black-pod control has never been pushed in Ghana because losses from this disease had been small prior to 1957-58. The low 1957-58 main crop has not kept farmers from buying sprayers and chemicals for the control of capsids.

Tree condition in Nigeria is reported very good, except for areas where there is severe capsid damage. The capsid control program in 1957 was not successful, as the farmers were unwilling to spend their own money to buy chemicals and sprayers. The Western Region did have an arrangement for loans to the cacao farmers, but few farmers took advantage of it. The trees are showing considerable capsid damage from attacks in July and August of 1957. A publicity program is acquainting the farmers with the need for capsid control, and informing them of simple arrangements made for them to get loans for chemicals and sprayers. The capsid spray program is expected to begin in July. The Western Region Ministry of Agriculture and Natural Resources has approved a plan for a survey of cacao around the mass-infected swollen-shoot areas. The present plan is to make a quick and intensive survey, show each farm on a large map, divide the area up into a number of sections and place a qualified technician in charge of each section.

Normally French West Africa (Ivory Coast) ranks fourth among the world's cocoa producing countries. In 1957-58, however, the Cameroun gained the fourth spot, and French West Africa dropped to fifth. The Cameroun experienced much better weather, as heavy rains in French West Africa damaged the crop and hampered fermenting and marketing.

The cacao area in the Cameroun has been increasing steadily, and in 1956 amounted to almost 500,000 acres. Production probably will increase somewhat in the next few years. Producers, mostly African, have received an average price of about 20 cents per pound during 1957-58. The difference between the producer and the f.o.b. price, less handling and commission costs, has gone to the "Price Stabilization Fund." Therefore, recovery has been made of the substantial losses sustained in supporting minimum prices to the producer during the 1956-57 marketing season.

The French West African Government, through the Stabilization Fund, is giving grants for cacao planting and about 25,000 acres of new cacao are going in each year. A considerable acreage of old trees, however, is being abandoned or taken out each year. There is much damage from capsids in French West Africa's cacao, even though the government has demonstrated that control pays. Generally, tree condition in the spring of 1958 is excellent due to favorable weather. Officials are now looking forward to an excellent 1958-59 crop.

### North and South America

Cocoa production in North and South America probably will be varied in 1957-58. Cocoa crops in Colombia and Ecuador are expected to exceed 1956-57 production somewhat, while production in the Dominican Republic will probably be less. Costa Rica's 1958 spring crop was delayed a

little, but weather conditions have reportedly been favorable for the crop to be harvested in October-December. In Mexico the excessive rains which damaged the winter crop have been followed by a prolonged dry period which is threatening to reduce the spring crop. Mid-spring rains in the Dominican Republic are said to have helped the summer crop.

Brazil, the second largest world cocoa producer, has had good weather, with adequate rainfall and normal temperatures. The 1958 Temporao crop (May-September) was about 2 weeks earlier than normal, with scattered small lots of beans arriving in dealers' warehouses the first week in May. This crop probably will amount to 1.6

#### Trade

U. S. imports of cocoa beans during calendar 1957 amounted to 510 million pounds compared to 559 million pounds in 1956. Imports of beans in 1957 increased, however, for each of the next 4 largest importing countries - West Germany, the Netherlands, United Kingdom and France. The over-all increase was 112 million pounds or 17.6 percent. Imports into the United Kingdom increased the most, amounting to 35 percent more than the relatively low 1956 imports. Imports into France rose by 15.7 percent in 1957 over 1956, while the Netherlands' imports were up by 12.4 percent and West Germany's by 9.6 percent above 1956.

Cocoa product imports into the United States amounted to 130 million pounds (bean equivalent) in 1957, compared to 121 million pounds in 1956. Cocoa butter imports during 1957 were more than double imports of 1956. Belgium was the biggest supplier, and Italy was the second largest. Conversely, cocoa bean imports declined about 10 percent in 1957 compared with 1956. Arrivals in the United States for 1958 through mid—May were 10 percent below the same period of the previous year. The 1957 imports for the like period were 20 percent below arrivals for the same period of 1956.

Brazil was the largest supplier of cocoa beans to the United States in 1957, supplying 110 million pounds. Imports from Ghana amounted to 109 million pounds in 1957, the same as in 1956. Nigeria was the third largest supplier, while the Dominican Republic ranked fourth, just ahead of French West Africa. U. S. imports from the Western Hemisphere in 1957 were one-third higher than in 1956.

Most of Ghana's cocoa bean exports in 1957 were to West Germany. The United States was the second largest market, and the United Kingdom the third. Nigeria was the largest supplier of the United Kingdom in 1957, while France ranked first as a market for exports from French West Africa. The Cameroun exported more beans to the Netherlands than to any other country. Brazil exported 109 million pounds of cocoa beans to the United States in 1957, compared with 95 million pounds to all of Europe. Two-thirds of Venezuela's cocoa bean exports in 1957 were to the United States.

In May 1957 Brazil established a minimum export for cocoa beans of 31.60 cents per pound f.o.b. By November 1957 the African crops were expected to be considerably smaller and New York Spot Prices climbed above the 40 cent level. Then in February 1958 Brazil increased its minimum to about 40.75 cents

Imports of Cacao and Chocolate Products, by Census Classifications

Foreign Agricultural Service. Compiled from official records of the Bureau of the Census.

per pound f.o.b. From May 1957 through October New York Spot Bahia average monthly prices were somewhat above Accra prices. Beginning in November 1957, however, Accra prices on a monthly basis have averaged slightly higher than Bahia prices.

Cocoa bean grindings in the United States in 1957 amounted to 516.9 million pounds, an increase of 3.4 percent compared to 500 million in 1956. Grindings were down by 6.7 percent in the first quarter of 1958 compared to the first quarter of 1957. Further decreases during 1958 have been predicted, as substitutes are expected to be used more. Inventories probably will also be reduced somewhat in 1958.
